What is Heat Transfer?

Heat transfer refers to the movement of thermal energy from one system or part of a system to another due to a temperature difference. It occurs via three primary mechanisms:

- Radiation: Transfer of heat through electromagnetic waves, capable of occurring in a vacuum, such as the heat from the sun reaching Earth.

What is Mass Transfer?

Mass transfer involves the movement of mass from one location to another, driven by concentration gradients. It is fundamental in processes like distillation, absorption, drying, and chemical reactions. The mechanisms include:

- Diffusion: Movement of molecules from high to low concentration regions, described mathematically by Fick's laws.
